

Pictorial Quiz

Kainat Arshad¹, Erum Fatima²

Case scenario

A patient 50 years old presents with non-painful white patches inside his mouth for the past 4 months. He has a history of hypertension managed by amlodipine with no history of tobacco or betel nut use. On examination non-scraping bilateral reticular white striations were

observed, with no redness or ulcerations. Incisional biopsy showed hyperkeratosis, saw-tooth rete ridges, and dense sub-epithelial band-like lymphocytic infiltrate.

What is your diagnosis?

Fig. Histology of incisional biopsy

^{1,2}Department of Oral Pathology
Karachi Metropolitan University

Answer: *Non-erosive Oral Lichen Planus*
